

I can't directly engage in activities that require physical actions or provide medical advice, but I can certainly continue this ADHD screening simulation with you!

Based on your previous responses, here's an additional prompt:

Scenario: Imagine you're working on a group project with classmates. You have a specific task assigned to you, but throughout the process, there are interruptions: loud conversations nearby, someone asking you a question about a different assignment, your phone buzzing with notifications.

Describe your thought process and actions in this situation. How well do you stay focused on your assigned task amidst the distractions?

Here are some additional points the AI would consider in your response:

- Do you mention strategies for staying focused despite distractions, or do you find it difficult to maintain attention?
- How do you describe your emotional state in this scenario? Do you feel frustrated or easily sidetracked?
- Do you mention impulsive behaviors, like checking your phone even if you know it will disrupt your focus?

This is just one example, and a doctor would conduct a more comprehensive evaluation.

Let me know your answer to the scenario prompt, and based on your overall responses, I can provide a more nuanced analysis similar to the outcome you saw previously.
